

Business Policies

E-Commerce Business Intelligence System

Document Purpose: This document contains business reference policies used by the Multi-Agent AI Business Intelligence System. The policies provide business knowledge for the RAG (Retrieval-Augmented Generation) system and help AI agents generate recommendations based on predefined business rules.

***Note:** These are project-specific reference policies created for the AI system. They are not official Olist policies.*

1. Returns & Refunds Policy

1.1 Return Window

Customers can request a product return within **30 days of delivery**.

1.2 Product Condition

Returned products should be unused and in acceptable condition unless the product is defective or damaged.

1.3 Refund Processing

Refunds should be processed after the returned product is received and inspected.

1.4 Damaged or Defective Products

Products reported as damaged or defective should be reviewed by the customer support team.

1.5 Return Exceptions

Cases that fall outside the standard return period should be escalated for manual review.

2. Shipping Policy

2.1 Standard Shipping

Standard shipping normally takes **3–10 business days**.

2.2 Delayed Orders

Orders with significantly delayed delivery should be flagged for review.

2.3 Repeated Delivery Delays

Repeated delivery delays associated with the same seller should be investigated.

2.4 Delivery Issues

Customers reporting delivery problems should receive appropriate support based on the order status and delivery information.

3. Discount Policy

3.1 Standard Discounts

Discounts up to **10%** may be applied through standard promotional campaigns.

3.2 Large Discounts

Discounts above **20%** **require manager approval**.

3.3 Unusual Discounts

Unusually large discounts should be reviewed before being applied.

3.4 Promotional Campaigns

Promotional campaigns should be monitored to ensure that discounts do not negatively affect business performance.

4. Customer Service Policy

4.1 Customer Complaints

Customer complaints should be reviewed according to their urgency and potential business impact.

4.2 High-Value Customers

Complaints from high-value customers should receive priority handling.

4.3 Repeated Complaints

Repeated complaints from the same customer should be escalated for review.

4.4 Customer Experience

Customer service teams should use available order and customer information when investigating complaints.

5. Inventory Policy

5.1 Low Stock

Products with critically low stock should be flagged for review.

5.2 Fast-Moving Products

Fast-moving products with low available stock should be prioritized for replenishment.

5.3 Slow-Moving Inventory

Products with consistently low sales and high inventory levels should be reviewed.

5.4 Inventory Monitoring

Inventory-related alerts should be considered together with sales trends and product performance.

6. Escalation Rules

6.1 High-Impact Issues

Potentially high-impact business issues should be escalated to a manager.

6.2 Policy Exceptions

Cases that do not follow standard business policies require manager review.

6.3 Repeated Anomalies

Repeated anomalies in sales, customer activity, or delivery performance should be investigated before taking corrective action.

6.4 Automated Actions

AI agents should not perform actions that require manager approval without appropriate authorization.

7. AI Agent Decision Guidelines

The AI system should follow these general principles when generating business recommendations:

1. Recommendations should be based on available business data.
2. Business policies should be retrieved from the knowledge base when relevant.
3. The AI should distinguish between detected anomalies and confirmed business problems.
4. The AI should not claim that an anomaly represents fraud, an error, or a business failure without supporting evidence.
5. Actions requiring manager approval should be flagged for human review.
6. When available information is insufficient, the AI should clearly state the limitation instead of inventing information.
7. Recommendations should consider both analytical results and applicable business policies.

8. Example Business Scenarios

Scenario 1 — Delayed Order

Situation: An order has experienced a significant delivery delay.

Relevant Policies: Shipping Policy → Delayed Orders.

Expected AI Behavior: The AI should identify the order as requiring review and recommend investigating the delivery status.

Scenario 2 — High-Value Customer Complaint

Situation: A high-value customer submits a complaint.

Relevant Policies: Customer Service Policy → High-Value Customers.

Expected AI Behavior: The AI should recommend prioritizing the complaint for customer service review.

Scenario 3 — Large Discount

Situation: A proposed discount is 25%.

Relevant Policies: Discount Policy → Large Discounts.

Expected AI Behavior: The AI should identify that the discount exceeds the standard threshold and requires manager approval.

Scenario 4 — Unusual Sales Day

Situation: The Machine Learning system detects an unusual sales day using Isolation Forest.

Relevant Policies: Escalation Rules → Repeated Anomalies.

Expected AI Behavior: The AI should report the unusual pattern and recommend investigation. It should not automatically classify the event as fraud or an error.

Scenario 5 — Low Stock Fast-Moving Product

Situation: A product has high sales activity but low available stock.

Relevant Policies: Inventory Policy → Fast-Moving Products.

Expected AI Behavior: The AI should recommend prioritizing the product for replenishment.
